

Autosubmit 2.3

M. Asif, D. Manubens, O. Mula

Outline

- Introduction
- Structure changes
- Dynamic templates
- Remarks

Introduction

- Modularisation: GIT structure

Introduce a better version control system for the templates and model sources and more options to create new experiments based on different developments by the user

- Runtime dynamic variables

A change on a variable value in “expdef_<expid>.conf” does not require a re-creation of the experiment. Values are read at runtime

- Dynamic headers

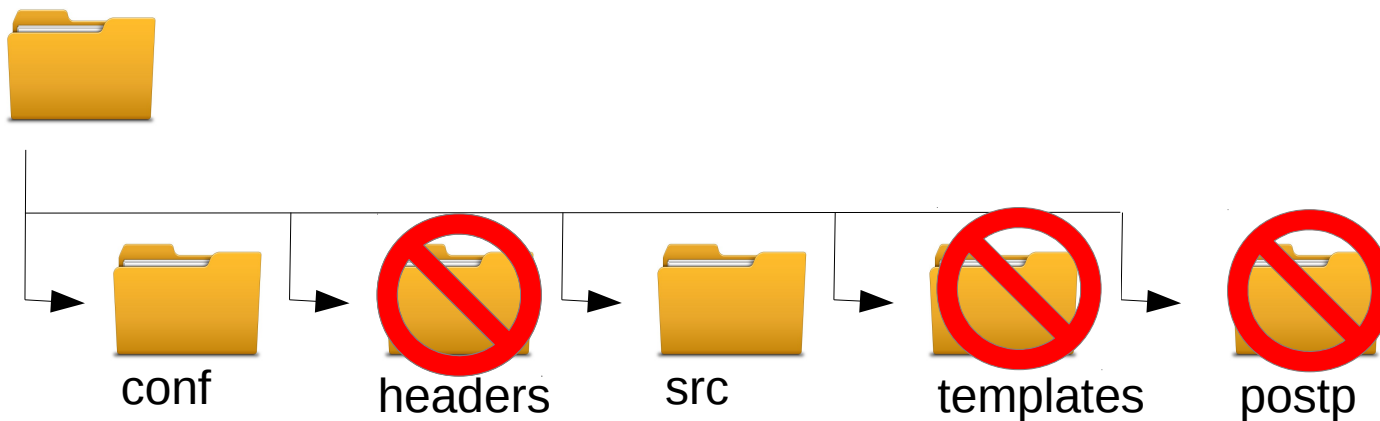

Header inclusion simplified and new variables introduced. Wall-clock time and number of processors can be adjusted by the user from “expdef_<expid>.conf”

- Dynamic template generation

Improved template management. The executable scripts are created at runtime.

Structure changes

~/autosubmit 2.1

~/autosubmit 2.3

templates

- After changes

- Separate projects

Templates

```
Switched to a new branch 'develop-1.1'
dmanubens@tyr~ /home/dmanubens/tmp/templates.git~$
├── common
│   ├── common.conf
│   ├── common.localsetup
│   ├── common.localtrans
│   └── common.remotesetup
├── ecearth
│   ├── ecearth.clean
│   ├── ecearth.conf
│   ├── ecearth.ini
│   ├── ecearth.post
│   └── ecearth.sim
└── ecearth3
    ├── ecearth3.clean
    ├── ecearth3.conf
    ├── ecearth3.ini
    ├── ecearth3.post
    └── ecearth3.sim
```

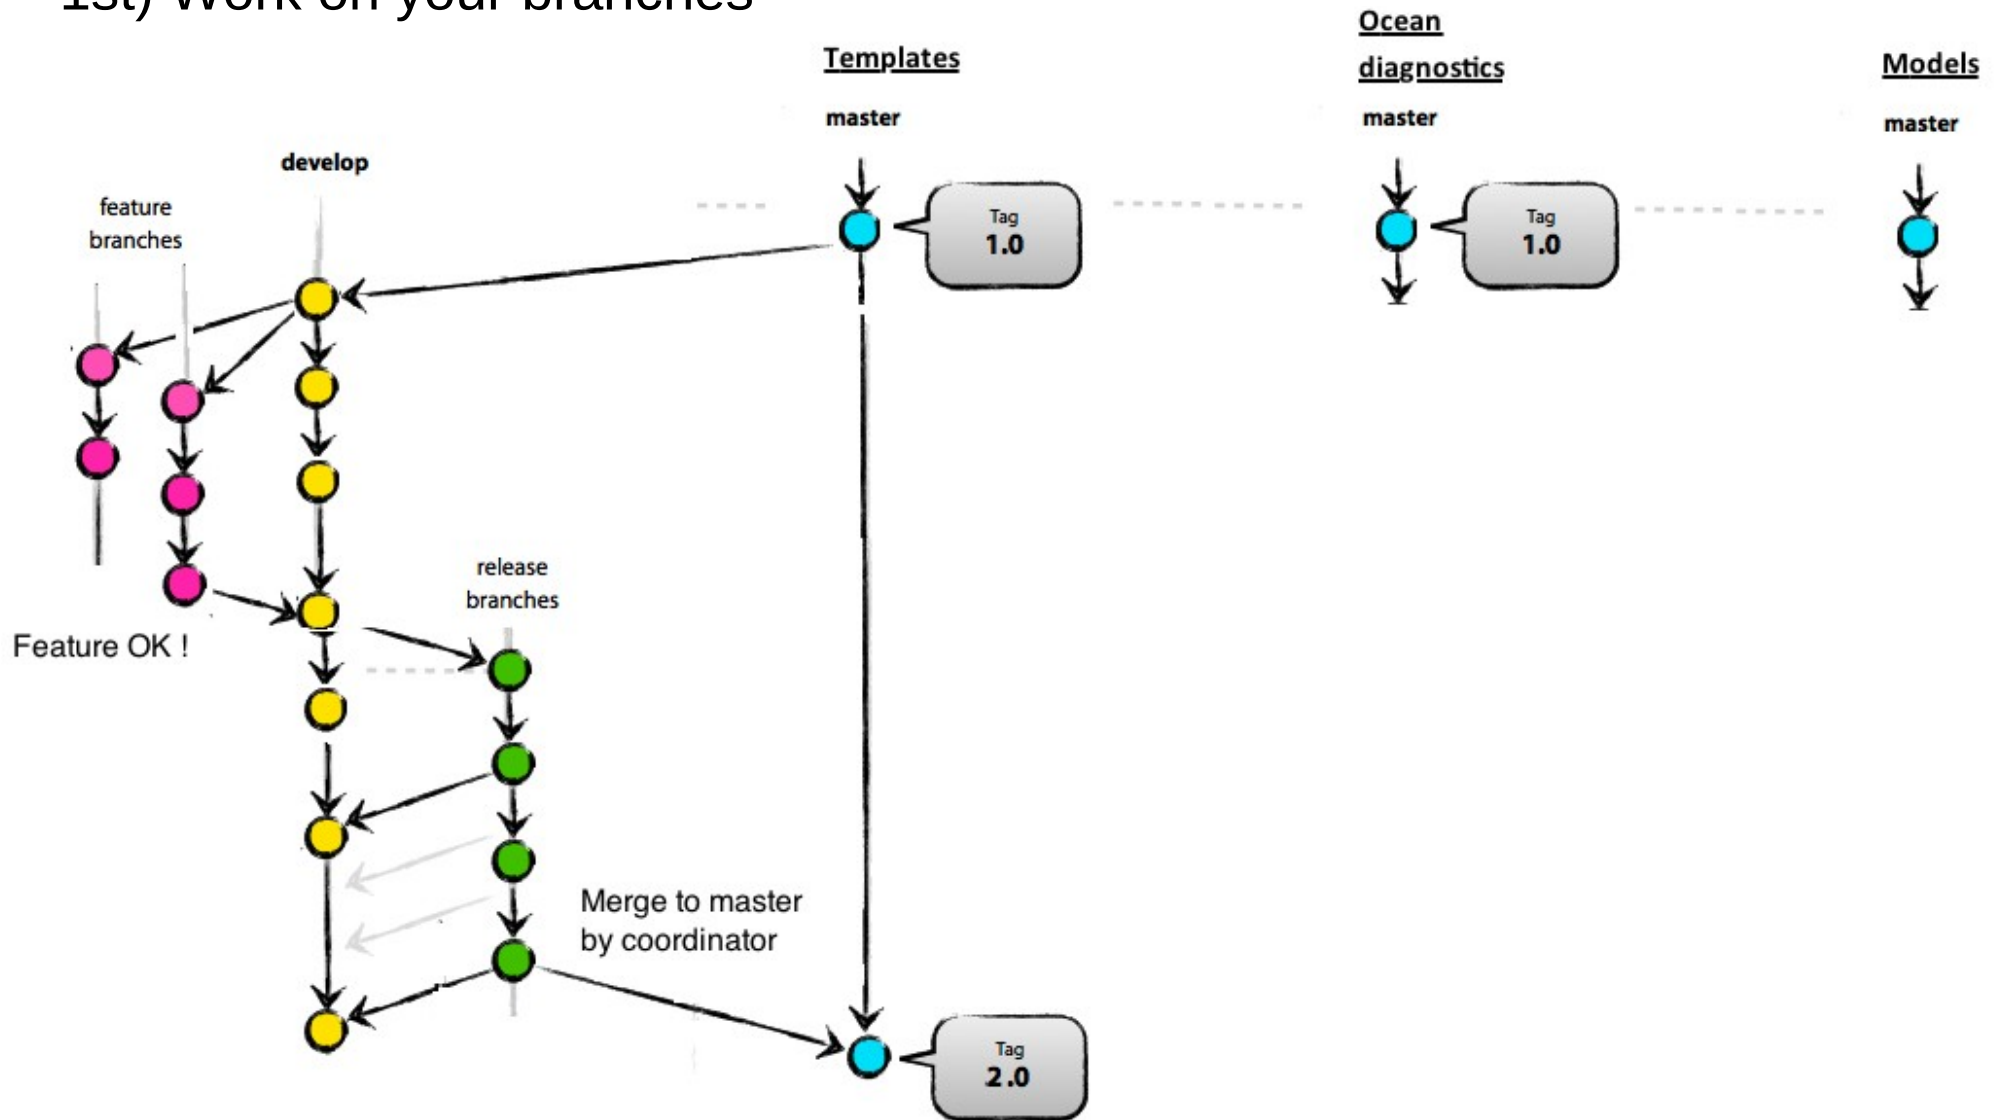

Models

```
dmanubens@tyr~ /home/dmanubens/tmp/ecearth~$
├── setup
│   └── ctrl
└── sources
    ├── doc
    ├── runtime
    └── sources
```

Ocean diagnostics

```
Already on 'master'
dmanubens@tyr~ /home/dmanubens/tmp/ocean_diagnostics~$
├── common_ocean_post.txt
├── config_file-ocean_pp.bash
├── ocean_pp.bash
└── README
```

- 1st) Work on your branches

- 2nd) Create your experiment

Experiment arguments

- Before

```
python expid.py -h
```

```
usage: expid.py [-h] (--new {ecearth,ecearth3,ifs,ifs3,nemo} | --copy COPY)
               --HPC {bsc,hector,ithaca,lindgren,ecmwf,marenosturm3}
               --description DESCRIPTION
```

```
python expid.py --new ecearth --HPC ithaca --description "experiment is about..."
```

- After (new options to link with git repositories)

```
python expid.py -h
```

```
usage: expid.py [-h] (--new | --copy COPY)
               --HPC {bsc,hector,ithaca,lindgren,ecmwf,marenosturm3}
               --model_name {ecearth,nemo}
               --model_branch MODEL_BRANCH {master (default), v3.0.1, v2.3.0, develop-v3.0.1, develop-v2.3.0, ...}
               --template_name {ecearth,ecearth3,ifs,ifs3,nemo}
               [--template_branch TEMPLATE_BRANCH] {master (default), develop, develop-SPPT, ...}
               [--ocean_diagnostics_branch OCEAN_DIAGNOSTICS_BRANCH] {master (default), develop, ...}
               --description DESCRIPTION
```

examples:

```
python expid.py --new --HPC ithaca --model_name ecearth --model_branch v2.3.0 --template_name ecearth --description "ex
python expid.py --new --HPC ithaca --model_name ecearth3 --model_branch develop-v3.0.1-nudging --template_name ecearth3
--template_branch develop-nudging --description "experiment is about..."
```

Dynamic templates

- Templates have a configuration file with the list of variables.
- A new type of variable `INCLUDE_*` allows the inclusion of external scripts for the usage from the templates i.e. “common_ocean_post.txt”
- Common templates have a configuration file with the list of common variables. (wallclock, numproc, ...)
- All variables are merged in the “expdef_<expid>.conf” where the user can put the values.
- The executable scripts are created at runtime

Remarks

- The templates can be updated on the fly ?
 - Yes, stop and run again the experiment will make the changes available for further running. The updates are under version control.
- New variables can be added in the configuration files on the fly ?
 - Yes. Added variables in the templates GIT project are not transferred to an existing configuration. Current “expdef_<expid>.conf” has to be updated.
- The autosubmit.conf, expdef.conf, archdef.conf variable values can be updated on the fly ?
 - Yes. Except for the variables defining the extension of the experiment. (Startdates, chunks, ...)

Remarks

- I want to run experiments created with Autosubmit 2.0, 2.1 or 2.2. How do I do that?
 - Clone the old Autosubmit version (2.0, 2.1, 2.2) with which you created the experiment and run

```
git clone https://dev.cfu.local/autosubmit.git <localdir>  
git checkout <tag>
```

- I want to run it with latest Autosubmit 2.3...NOT POSSIBLE directly:
NO BACKWARDS COMPATIBILITY
- How do I know what templates project can I use ?
 - Autosubmit 2.3 only runs with template version ≥ 1.1
 - Why? Because template files are now ready to be under version control. Additionally they include a variable for the HEADER, new experiment DYNAMIC variables under template specific configuration file and new PATHS w.r.t. new GIT structure

Autosubmit 2.3
